ASCENSION TRACKER

User Guide

Gamified Personal Growth for iOS

Version 1.0

1. Overview

AscensionTracker is a gamified personal development app for iOS that turns your daily habits and goals into an RPG-style leveling experience. Inspired by the world of hunters and ranks, the app motivates users to build consistent routines by framing self improvement as a quest for ascension.

The app connects to a Firebase backend for cloud syncing and social features, enabling users to share progress with friends and compete on a Guild Leaderboard.

2. Requirements & Setup

2.1 System Requirements

Requirement	Details
Platform	iOS (iPhone and iPad)
Development Environment	Xcode (latest stable version recommended)
Language	Swift / SwiftUI
Backend	Firebase (Firestore)
Dependencies	FirebaseCore, FirebaseFirestore (via Swift Package Manager)

2.2 Opening the Project

1. Unzip the AscensionTracker-main.zip archive.
2. Open AscensionTracker.xcodeproj in Xcode.
3. Allow Xcode to resolve Swift Package Manager dependencies automatically.
4. Select a target device or simulator and press Run (Cmd + R).

2.3 Firebase Configuration

A GoogleService-Info.plist file is included in the project and is pre-configured for the development Firebase project. If you need to connect to your own Firebase project, replace this file with the one downloaded from your Firebase Console, then ensure Firestore is enabled in the console.

3. App Structure

The app is organized around a central dashboard that provides quick access to all major features. Navigation uses SwiftUI's NavigationStack with NavigationLinks to push subviews onto the stack.

Screen	Swift File	Purpose
Dashboard 	ContentView.swift	Main hub: profile summary, streak, leaderboard shortcuts, and navigation buttons
Quest Log 	ContentView.swift	Daily habit checklist with completion toggles

Calendar 	ContentView.swift	Monthly grid showing activity completion history
Growth Journal 	ContentView.swift	Free-text daily reflection editor

User Profile 	ContentView.swift	Hunter stats (STR/INT/AGI), rank, and trophy case
Friends List 	ContentView.swift	Social leaderboard with friend levels and XP progress

4. Feature Reference

4.1 Dashboard (Home Screen)

The Dashboard is the first screen users see after launch. It provides a high-level snapshot of the user's progress and serves as the navigation hub for all other features.

User Profile Card

- Displays the hunter's name, rank (e.g., B-Class), and current level.
- A progress bar shows XP progress toward the next level.
- Tapping this card navigates to the full User Profile screen.

Activity Streak

- Shows the number of consecutive days the user has logged activity.
- Displayed as a large monospaced number to emphasize consistency.

Guild Leaderboard Preview

- Shows the top three friends ranked by XP earned.
- Tapping the card navigates to the full Friends List screen.

Navigation Buttons

- Quest Log: Opens the daily habits/tasks checklist.
- Calendar: Opens the monthly activity calendar.
- Growth Journal: Opens the daily reflection editor.

4.2 Quest Log

The Quest Log is the core habit-tracking feature. It presents a daily list of tasks (quests) that the user should complete to maintain their streak and earn XP.

Current Quests (Default)

Quest	Category
Drink 2L of Water	Health
Read 10 pages	Learning
Code for 1 hour	Skill Development
Workout	Fitness

Completing a Quest

5. Tap the checkbox icon on the left of any quest row.
6. The checkbox fills with a cyan checkmark to indicate completion.
7. Tap again to toggle it back to incomplete if needed.

Adding Custom Quests

Note	The + button is present in the UI. Custom quest creation will be fully enabled once the Firebase backend integration is complete. Tapping the button currently shows an informational alert.

4.3 Calendar

The Calendar screen provides a visual history of activity over the current month. Each day shows whether key habits were completed, helping users identify patterns and gaps.

Using the Calendar

- Days with a cyan checkmark icon indicate activity was logged on that date.
- Tap any date to view the Day Detail panel at the bottom of the screen.
- The Day Detail panel shows which specific items (e.g., Daily Reflection, Quests Completed) were logged on the selected day.
- The currently selected date is highlighted in cyan.

4.4 Growth Journal

The Growth Journal is a private daily reflection tool. Users can write notes, observations, or intentions to track their personal development over time.

Writing a Journal Entry

8. Tap inside the text editor area.
9. Type your reflection or notes.
10. Tap the + button to save and clear the editor for a new entry.
11. A confirmation alert will appear confirming the entry was recorded.

Tip	Journal entries are currently stored locally. Cloud persistence via Firebase will be added in a future update.

4.5 User Profile

The User Profile screen displays the hunter's identity, character statistics, and earned trophies.

Profile Sections

- Avatar & Info: Displays the hunter's name and rank (e.g., B-Class).
- Stats Grid: Shows three core RPG-style attributes.

Stat	Name	Represents
STR	Strength	Physical activity and fitness habits
INT	Intelligence	Learning, reading, and skill-building habits
AGI	Agility	Consistency, speed, and productivity habits

- Trophy Case: A grid of earned achievement icons. Empty slots appear as dashed squares until unlocked.

4.6 Friends List

The Friends List is the social hub of the app. It shows all connected friends, their current level, and their XP progress toward the next level.

Reading the Friends List

- Each row shows the friend's name, level, and a progress bar indicating XP progress.
- Friends are listed with their level to allow quick comparison.

Adding a Friend

Coming Soon	The Add Friend button is present in the UI. Friend-adding functionality will be enabled once the social backend layer is complete.

5. Data Model

User data is persisted in Firebase Firestore. The DatabaseManager class handles all cloud operations.

5.1 Hunter Profile (users collection)

Field	Type	Description
hunterName	String	Unique username and document ID
level	Int	Current experience level
rank	String	Hunter class rank (e.g., B-Class)
streak	Int	Number of consecutive active days
dateCreated	Timestamp	Account creation date

5.2 Creating a Profile (DatabaseManager)

Call createHunterProfile(username:level:hunterClass:) to create or overwrite a user document in Firestore. The document ID is set to the username for direct lookups.

6. Known Limitations & Roadmap

The following features are visible in the UI but are pending full backend integration:

Feature	Current State	Planned
Custom Quest Creation	Alert placeholder shown	Full CRUD via Firestore
Add Friend	Button present, no action	Firebase-based social graph
Journal Persistence	In-memory (clears on close)	Firestore cloud save
Live Streak Tracking	Static display	Calculated from Firestore logs
XP & Level Progression	Static values in UI	Dynamic calculation engine

7. Quick Reference

Action	How To
Open Quest Log	Tap Quest Log button on Dashboard
Complete a Quest	Tap the checkbox on the quest row
View Activity History	Tap Calendar button on Dashboard
Write a Journal Entry	Tap Growth Journal, type, then tap the + button
View Your Profile	Tap the profile card at the top of the Dashboard
View Friends	Tap the Guild Leaderboard card on the Dashboard
